COLOR DOPPLER / DUPLEX ULTRASOUND REPORT

Left Lower Limb Arterial Study

Patient Details

Patient Name Mr. Ramesh Bhat
Age / Sex 72 Years / Male
Patient ID 789342

Referral / Exam

Referring Doctor Dr. Neha Rao
Examination Date 2-9-2023

Technique

Duplex evaluation of the right lower limb arteries was performed using B-mode, Color and Spectral Doppler imaging. Peak systolic velocities (PSV) and waveform morphology were assessed for flow characteristics and evidence of occlusive disease.

Findings — Right Lower Limb

Artery	PSV (cm/s)	Waveform	Remarks
Common Femoral Artery	62	Biphasic	Markedly dampened flow; intimal thickening and plaque deposition.
Profundus Femoris	55	Monophasic	Reduced amplitude; atherosclerotic changes evident.
Proximal Superficial Femoral Artery	48	Monophasic	Significant luminal narrowing with low velocity and tardus-parvus waveform.
Mid SFA	42	Monophasic	Severe flow reduction; poor distal transmission.
Distal SFA	38	Monophasic	Markedly reduced PSV; evidence of distal stenosis/occlusion.
Popliteal Artery	35	Monophasic	Dampened waveform with poor forward flow; consistent with severe ischemia.
Posterior Tibial Artery	28	Monophasic	Very low velocity; minimal distal perfusion visualized.
Anterior Tibial Artery	30	Monophasic	Absent triphasicity; near occlusive flow characteristics.

Ankle—Brachial Index (ABI)

ABI: 0.39

Impression

- Severe reduction in PSV values with diffuse monophasic, low amplitude waveforms throughout the right lower limb.
- Findings consistent with advanced multilevel arterial occlusive disease and poor distal perfusion.

Dr. A. K. Mehta, M.D.
Consultant Vascular Radiologist
