COLOR DOPPLER / DUPLEX ULTRASOUND REPORT

Left Lower Limb Arterial Study

Patient Details

Patient Name Anita Sharma
Age / Sex 38 Years / Female
Patient ID AS-2025-1204

Referral / Exam

Referring Doctor Dr. S. Menon
Examination Date 13-11-2025

Technique

Duplex evaluation of Left lower limb arteries was performed using B-mode, Color and Spectral Doppler imaging. Peak systolic velocities (PSV) and waveform patterns were analyzed in standard arterial segments — Common Femoral, Superficial Femoral (SFA), Popliteal and Tibial arteries. Measurements obtained at rest; care taken to optimize insonation angle.

Findings — Left Lower Limb

Artery	PSV (cm/s)	Waveform	Remarks
Common Femoral Artery	104.2	Triphasic	Normal PSV and triphasic waveform; no focal acceleration.
Profundus Femoris	88.0	Triphasic	Normal flow pattern; no hemodynamically significant lesion seen.
Proximal Superficial Femoral Artery	99.5	Triphasic	PSV within expected range; waveform triphasic.
Mid SFA	86.8	Triphasic	No focal stenosis or dampening of waveform.
Distal SFA	80.1	Triphasic	Physiologic velocity; triphasic waveform preserved.
Popliteal Artery	92.6	Triphasic	Normal spectral pattern; no turbulence or aliasing.
Peroneal / Posterior Tibial Artery	71.4	Triphasic	Distal tibial arteries show preserved triphasic flow and physiologic PSV.
Anterior Tibial Artery	73.8	Triphasic	Normal amplitude and contour for distal vessel.

Ankle—Brachial Index (ABI)

ABI: 1.08 (Left)

Impression

- Ankle—Brachial Index within normal range (ABI 1.08).
- Triphasic waveforms are preserved throughout the examined arterial tree of the left lower limb with physiologic peak systolic velocities at femoral, popliteal and tibial levels.
- No hemodynamically significant arterial stenosis or occlusion identified on this study. Findings consistent with **no evidence of Peripheral Arterial Disease** on the left. Correlate with symptoms and clinical examination as indicated.

Dr. K. Iyer
Consultant Vascular Radiologist
